Enterprise AI Adoption and Subscription Analysis

Group business analytics project | ChatGPT and Microsoft Copilot | Portfolio-safe aggregate results

105	76	72	48
employees analyzed	used ChatGPT	used Copilot	used both tools

Business objective

Evaluate whether enterprise AI subscriptions align with actual usage, identify adoption differences across workforce segments, and translate the findings into practical license-allocation and governance recommendations.

End-to-end workflow

Source integration	Data cleaning	Metric design	Segmentation	Executive report

Selected findings

Analysis area	Evidence	Business implication
Cross-tool adoption	48 employees used both tools (about 46%).	AI tools were already broadly accepted in daily work.
Adjusted usage	58 users favored Copilot; 28 favored ChatGPT after adjusting for active days.	Raw totals alone did not capture habitual use.
Role allocation	Producer roles had high Copilot coverage but much lower average use than other roles.	License allocation may not match realized value.
Worker access	Contingent workers used Copilot at an intensity close to full-time staff.	Official access and governance may need review.
Management adoption	Managers and non-managers showed similar usage intensity.	Leadership-driven adoption was not yet visible.
Dormant access	About 20%-30% of subscribed accounts showed no usage.	Routine license reviews could reduce waste.

Management recommendations

Reallocate licenses using observed activity; establish compliant access for contingent workers; deliver role-specific training for Producers and managers; and monitor dormant subscriptions with recurring adoption KPIs.

Contribution and tools

Group project. I participated across data integration, cleaning, metric construction, PivotTable analysis, visualization, interpretation, and report preparation. Tools and skills: Excel, VLOOKUP, PivotTables, segmentation, business analysis, and executive reporting.

Privacy boundary	The employee-level workbook is excluded because it contains names, email or enterprise accounts, employee IDs, and individual usage records. Only aggregate results are shared.
